

CERTIFIED PROFESSIONAL PATHWAYS

Certified Professional in Energy (CPE)

Why become certified in CPE?

Professionals can earn digital badges by completing a series of online certification exams, each recognising verified knowledge and practical skills in key areas of energy management. These badges mark progress toward becoming a **Certified Professional in Energy (CPE)** - a credential that demonstrates the ability to plan, implement and manage effective energy programmes.

The certification pathway covers a comprehensive range of topics, including Planning Fundamentals, Goal Setting, Target Setting and Monitoring and an Introduction to Systems Thinking. It also explores core principles such as Efficiency First, Fuel Switching and Change Management, alongside practical skills in Preparing and Understanding Business Cases. Learners gain a strong understanding of Energy Types, Forms, Media and Vectors, ISO 50001 and Basic Measurement and Verification, while developing applied knowledge in Energy Efficiency and Energy Markets and Procurement. The pathway culminates in a Capstone Project, where participants design and implement a complete Energy Management Programme, demonstrating their ability to apply learning in a real-world context.

Earning these badges showcases professional credibility, builds capability and highlights commitment to excellence in sustainable energy management.
